

a¹ a display unit rotatably attached to the main unit; and
a retaining mechanism retaining at least one portion of the input device into the space
which is formed by the display unit and the main unit.

a² 3. (Amended) The electronic apparatus as claimed in claim 1, wherein the supporting member is mounted so as to be storable in the main unit when the input device is not being stored.

a³ 5. (Amended) The electronic apparatus as claimed in claim 1, wherein the engaging member is mounted so as to be storable in the main unit when the input device is not being stored.

a⁴ 7. (Amended) An input device detachably connected to an electronic apparatus having a main unit and a display unit rotatably attached to the main unit, the input device comprising:
at least one engaging member engaging the main unit so that at least one portion of the input device is retained into the space which is formed by the display unit and the main unit.
